

SWISH: STRATEGIC GROWTH

Finance Framework for Scaling India's Fastest 10-Minute
Delivery Platform

BY

Sushant Faujdar

EX-Meesho, IIT Kanpur

The Problem: The Unit Economics Crisis

The 10-minute food delivery landscape is currently plagued by unsustainable economics. As evidenced by recent market exits (like Swiggy Snacc), legacy models relying on broad reach and standalone hubs are bleeding capital. They suffer from low-density orders and high customer acquisition costs with poor retention

The Swish Solution: Density & Intent

Swish counters this with a "vertical-only" micro-kitchen model designed specifically for hyper-local density and rapid profitability.

The following framework outlines our roadmap to capture abandoned market share.

Over the next three slides, we will detail our strategy to pivot towards high-intent acquisition channels, optimize our customer acquisition cost (CAC) payback periods, and use predictive behavioral signals to acquire and retain high-lifetime-value (LTV) power users.

The 10-Minute Frontier: Capturing Market Share.

⚠️ COMPETITOR EXIT · FEB 2026

Status: Completely shut down across its only two pilot cities (Bengaluru & Gurugram).

Cause: Unsustainable cash burn. The standalone hub model failed to generate enough order volume to cover high fixed infrastructure and rider costs.

STRATEGIC MODEL COMPARISON

✓ SWISH

- Operations: Bengaluru & newly launched in Gurugram.
- Model: Full-stack micro-kitchens ("Delight Centers"). We own the food, the margin, and the delivery.
- Advantage: Hyper-dense radius (1.5km), high-repeat SKUs, capturing 100% of the food profit margin.

✗ SNACC

- Operations: Peaked and died in Bengaluru & Gurugram.
- Model: Standalone delivery hubs.
- Failure Point: Acted only as a delivery node. Squeezed margins, high spoilage risk, and inability to control preparation times.

DAILY ORDER MARKET SHARE

10-minute food & snack delivery segment · 2025

What does Swish know about 10-minute food delivery that Zomato or Swiggy don't?

While legacy food delivery giants like Swiggy, Zomato, and Zepto are abandoning or scaling back their 10-minute hot food experiments due to unsustainable cash burn and partner friction, Swish is rapidly attracting investor capital by utilizing a fully vertical business model. Unlike aggregators acting as middlemen, Swish owns its entire operational stack—from cloud kitchens and menus to the supply chain—within a hyper-dense delivery radius. This allows them to bypass restaurant inefficiencies and make the unit economics work through high customer order frequency, which offsets the high logistical costs of single-order deliveries. Moving forward, their ultimate challenge remains convincing a skeptical market that genuinely high-quality food can consistently be prepared and delivered within a strict 10-minute window.

Deep Dive

- The Demise of Swiggy Snacc:** Completely shut down. Their 2025 pilot (Bengaluru/Gurugram) failed due to low average order values and high overhead. Swiggy has fully abandoned the standalone 10-minute food model.
- Zomato's Surrender:** Exited the market after two failed attempts ("Instant" and "Quick"). Low volumes and severe restaurant friction forced them to abandon 10-minute food entirely and rely on Blinkit Bistro.
- Zepto Cafe's Reality Check:** Forced to scale back daily orders from a 120k peak down to ~70k. They closed 44 cafe locations to control severe cash burn, citing supply chain and kitchen staff shortages.
- Swish's Positioning:** Expanding rapidly across Bengaluru and Gurugram. Our vertical, in-house model focuses on high-repeat SKUs, successfully bypassing the margin squeeze and partner friction that killed legacy competitors.

ACQUISITION STRATEGY: SCALING INTENT-DRIVEN GROWTH

Signal-Based Targeting

Temporal Dayparting (Time-Based Ads)

Don't run ads all day. Implement dayparting via **ad scheduling** to concentrate spend during peak craving windows: 3:30 PM - 5:30 PM (Mid-day slump/Tea time) and 11:00 PM - 1:00 AM (Late-night binge).

Offer Sensitivity–Driven Acquisition

Leverage CAPI-driven signals (discount usage, full-price purchases) to segment users by price elasticity and build custom events + lookalikes in Ads Manager.

Deploy differentiated creatives and selectively apply incentives to maximize incremental conversions.

Behavioral & App-Overlap Signals

Bid on high-intent search terms like “late-night delivery,” and location-specific food queries to capture demand signals.

The proposed channel mix and budget ratios represent an initial testing framework. We will treat the first 30 days as an aggressive testing period, doubling down on the channels that yield the highest intent signals and pausing those that inflate our CAC.

Restructured Budget Allocation

- **Meta Ads (Instagram Reels & Stories):** Highest visual appeal for food. Best for triggering impulse cravings.
- **Google SEM (Search Intent):** Bidding on high-intent, location-based keywords: "coffee near me," "late night snacks [area name]," "instant food delivery."
- **Corporate & Campus BTL (Below The Line):** Deploy geo-targeted offline activations across tech parks and college hostels within delivery radius, using QR-coded creatives linked to trackable installs.
- **UGC / Micro-Influencers:** Paying local neighborhood foodies to post Reels of the 10-minute delivery stopwatch test.

The Instagram "Hero SKU" Campaign

The "10-Minute Craving" Collection Ad

Instagram Shoppable Ad (Collection/Carousel format)

User Journey: Click on Item → App Store Install → Deferred Deep Link auto-adds the exact item to their cart upon first open.

The 4 Featured SKUs (Optimized for <3 Min Prep & High Repeat):

Iced Latte / Filter Coffee

Prep: < 60 seconds (Pour, seal, pack).
Signal: Targets the 3 PM – 5 PM corporate slump. High daily retention.

Loaded Peri-Peri Fries

Prep: ~3 minutes (Fast fry, toss, box).
Signal: Universal impulse trigger. High visual appeal for Meta ads.

Quick-Grill Paneer/Chicken Wrap

Prep: ~3 minutes (Pre-cooked fillings, quick assembly & toast).
Signal: Captures the substantial "meal replacement" hunger without the 30-minute prep time of a full meal.

Choco Lava Cake

Prep: < 90 seconds (Flash heat and pack).
Signal: Targets the 10 PM – 1 AM late-night sweet tooth demographic.

Conversion Quality & The Power User Loop

Activation Metrics

We do not optimize for app installs; we optimize for intent and activation. Our primary campaign health metric is 1OD-15D CAC (Cost to acquire 1 Order Delivered within 15 days of install).

Early-Stage Velocity Signals

Before the first transaction, we track two leading indicators of high LTV (Lifetime Value):

- 1. The Intent Metric: ≥ 2 Cart Views within 72 hours of install.
- 2. The Explorer Metric: Browsing ≥ 3 distinct menu categories (e.g., Coffee, Snacks, Meals) during the first session.

Campaign Optimization & Lookalike Strategy

Users hitting the 1OD-15D threshold or demonstrating both velocity signals are tagged as "Power User Seeds."

Instead of broad targeting, we continuously narrow our Top-of-Funnel (TOFU) campaigns to target **Lookalike audiences** based strictly on this newly identified, high-intent cohort.

We will also be feeding these device IDs back into Meta and Google as **custom events via server-to-server APIs**, aligned with the defined Power User criteria.

The funnel metrics and thresholds outlined above are illustrative baselines. Actual activation milestones will be rigorously defined and continuously restructured based on live cohort data and behavioral insights.

High LTV Identification & Retention: Day 0 → Day 7 Signals

D0

Install + First Session

Browse ≥ 3 categories → Flag 'Explorer.' Strong Week-2 order correlation.

D1

First Order Placed

Coffee/Snack SKU → activate 'Power User' nurture sequence.

D3

Re-engagement Window

No order D2–3 → trigger push: 'Your usual [SKU] ready in 10 min.'

Power Users (D7 ≥ 2 orders) drive 68% of 90-day revenue

Our Day 0 to Day 7 activation flow systematically nudges users from exploration to locked-in habits based on real-time behavioral signals. On Day 0, we target high-curiosity "Explorers" who browse broadly but hesitate to buy by deploying a 30-minute time-bombed push notification featuring a Hero SKU and free delivery to force that crucial first transaction.

If a user exhibits high intent but abandons their cart between Days 1 and 3 due to price sensitivity, we intervene with a targeted bundle up-sell via WhatsApp or in-app prompts, clearing checkout friction while protecting our Average Order Value (AOV).

Finally, once a user places their second order by Day 7, they are flagged as a high-value Power User.

From then only, shift focus on those users retention.

Experimentation Strategy to acquire High LTV users-
